This poster introduces the project Digital Documerica, a digital public project offering a search and discovery interface, interactive visualizations, and additional media resources to broaden the reach and access of a collection of nearly 16,000 documentary environmental photographs from the 1970s. Digital Documerica is available at https://digitaldocumerica.org/. The source code and all associated data are available under an MIT license from https://github.com/distant-viewing/digdocumerica/. The project engages with recent research and methods in the digital and public humanities to produce a generous interface that links together many different dimensions of the collection (Arnold et al. 2017, 2020; Brennan 2016; Caldwell et al. 2008; Wingo, Heppler, and Schadewald 2020; Whitelaw 2015). Additionally, the project experiments and evaluates ways to integrate recent advances in AI research, such as multimodal LLMs, into search and discovery interfaces (Arnold and Tilton 2024a, 2024b; Visual Media Workshop at the University of Pittsburgh, n.d.).

The United States Environmental Protection Agency (EPA) emerged in 1970 to implement policies that would support efforts to improve the health of the environment and American citizens (Kline 2007; Sellars 1997; Shubinski 2009). Within a year of the EPA's founding, the agency started a documentary photography project (Documerica) to record the current state of the environment and the improvements brought by new policies (Balaschak 2021; Environmental Protection Agency, Office of the Administrator, n.d.; Shahi 2023). Documerica's director, Gifford Hampshire, aimed to create a visual "baseline" of photographs that the EPA could compare to future photographs to determine their environmental policies' effectiveness (Bustard and Potter 2013). Photographers set out to capture environmental issues such as oil slicks in waterways, urban smog, and landfills near residential areas. Photographs offered visual evidence of the work that the nation needed to do to realize its new environmental goals (Perkins 2022; Simmons 2009; Stanfield 1980). Hampshire intended for the photographers to return in a few years and document cleaner water, clearer air, and better living conditions. By the time the project finished in 1976, the Documerica collection encompassed over 21,000 photographs taken by over 100 contract photographers in all 50 states and Puerto Rico (Peralta 1981).

Digital Documerica provides an interface to the nearly 16,000 public-domain Documerica photographs digitized and published by the U.S. National Archives (NARA). Despite collection's digital availability and its important connections to present conversations around environmental policy, Documerica is not as widely known or discussed as other documentary photography collection, particularly outside of academic publications (Taylor 2014). Our project builds awareness for the collection by creating meaningful conversations around these photographs and showing the state of the nation's environment in the 1970s, discussing how photographs shaped environmental policy, and connecting the images to environmental issues today (Cox and Tilton 2019). We open new modes of search and discovery that greatly extend the limited metadata currently available on the NARA site. Additional new research is also included alongside the collection, including a color correction algorithm that significantly improves the aesthetic qualities of the collection (Arnold and Tilton 2024a).

Landing on the first page of Digital Documerica, visitors are given a brief historical context and invited to explore the different entry points to the photographs (Figure 1). Visitors can choose to select a random photograph, select based on metadata, or start by looking at the collection as classified by 56 clusters (Figure 4). Descriptions of the clusters are given in Table 1 and 2. Clustering was done using dimensionality reduction from the terms used in automatically generated captions. Clicking on any thumbnail from a cluster shows a randomly selected photograph from the topic. This photograph is displayed on a dedicated page that includes archival metadata and automatically generated information (Figure 5).

The latter includes a caption that was auto-generated from a multimodal large language model. There is also a set of 16 images that have the most similar captions, allowing visitors to explore the collection along thematic and stylistic dimensions. A link to the authoritative NARA collection is given on each page for visitors who want to learn more about the physical archive. In addition to the photographs and visualization tools for exploring them, users can also listen to a set of original oral histories that will feature photographers and EPA administrators (Figure 7). The interviews provide context to the conditions that shaped which subjects were documented, the challenges of a large-scale photography project, and the work has been given to the long-term preservation of the collection. Visitors can then watch documentary vignettes highlighting and further contextualizing the environment's relationship to health, inequality, and everyday life.

As we think about the role of the climate and environment in our daily lives, the longer history of environmentalism and the condition of the United States in the 1970s provides an opportunity to understand the role of environmental agencies and policies in addressing our relationship to our natural world (Azoulay 2008; Hale 2019; Raiford 2011; Sandweiss 2002). The Digital Documerica project offers an powerful tool for exploring and placing these initiatives in context with current environmental efforts and research in documentary photography.

Figure 1. Screenshot of the landing page for the Digital Documerica public project. The project is currently hosted and publicly available at https://digitaldocumerica.org.

Figure 2. Screenshot of the default search page with all of the photographs initially available.

Figure 3. Screenshot of the search page when looking for the term horse beach. A total of 8 results are returned.

Figure 4. Screenshot of the cluster visualization page. Each block is a specific choosen image from one of the 56 clusters. Hovering over an image shows the tags that identify the given cluster. Clicking on an image brings up a dedicated page for the given image. Hovering over the question mark provides a textual description of the method used to generate the clusters.

Figure 5. Example page dedicated to a specific photograph. Archival metadata is shown first, followed by AI-generated data. Descriptions about the methods used are given when users hover over the question mark icons. Clicking on one of the recommended photos in the bottom left loads a new photo page for the selected photograph.

Figure 6. Example of the clusters detected using the automatically generated captions. Clicking on a cluster opens a search page that shows all of the images from a given cluster.

Figure 7. Example of a media element on the website. Here, we have a video essay that we produced detailing the work of Documerica photographer Bill Kuykendall.

Figure 8. The first set of 28 clusters in the collection according to text-based analysis of the automatically generated captions. Example images from each can be seen in the screenshot shown in Figure 4.

Figure 9. The second set of 28 clusters in the collection according to text-based analysis of the automatically generated captions. Example images from each can be seen in the screenshot shown in Figure 4.

Appendix

Below is the automatically generated captions for the following image in using the OpenAI API (Arnold and Tilton 2024b). The collection of captions for the images serve as the basis for the clustering and recommendation systems built into the site (Arnold and Tilton 2024b).

English Caption: This photograph portrays a scene inside a subway car, capturing a diverse group of passengers engaged in various activities. The interior of the car features rows of seats on either side, occupied by passengers, and advertisements displayed above the windows. The subway car has a metallic finish both inside and outside, with details characteristic of a typical older model subway, such as fluorescent lighting and handles for standing passengers. Most passengers are shown seated, facing the camera; a few are standing. Many are engrossed in reading newspapers or books, which seems to be a popular activity among them. The passengers display a range of attire from casual to semi-formal, reflective perhaps of different professions or personal styles. This attire, in combination with the various hairstyles and accessories, suggests the image may be from the 1970s or 1980s. There is a sense of quiet engagement, as the passengers mainly keep to themselves, engaged in their reading or lost in thought. The atmosphere conveys a typical public transit environment where each person is absorbed in their own world, amidst the shared space of the subway car. The individuals vary in appearance, including men and women of different ages and possibly different backgrounds, reflecting an urban, multicultural setting. Some details that speak to the era include the style of clothes, such as leather jackets and wide collars, and the physical styles of the subway car itself. Overall, the composition of the photograph captures a slice of urban life, showing how people coexist and share public spaces while engaged in personal activities, set against the backdrop of a city's public transit system.

Spanish Caption: Esta fotografía muestra el interior de un vagón de metro, probablemente en una ciudad grande como Nueva York durante la década de 1970. La imagen captura una escena cotidiana con pasajeros sentados y de pie dentro del vagón. Hay dos filas de asientos alineados a cada lado del vagón, con un pasillo en el centro que permite el movimiento. Los pasajeros, de diversas edades y orígenes, están mayormente inmersos en actividades tranquilas: muchos leen periódicos, revistas o libros. Las personas están vestidas con ropa típica de la época, como chaquetas de cuero, abrigos, camisas estampadas y pantalones de diferentes colores y estilos. Algunos están de pie, sosteniéndose de las barras y asas fijadas al techo para mantener el equilibrio. Se observa una diversidad étnica entre los pasajeros, lo cual refleja quizás la población urbana de esa época. El vagón está equipado con barras metálicas, asas y una serie de anuncios colocados en la parte superior de las ventanas y paredes. La iluminación parece amarillenta, posiblemente debido a las luces fluorescentes o al desgaste de la fotografía con el tiempo. Hay una atmósfera de quietud, con los pasajeros enfocados en sus propios asuntos, lo que crea una impresión de calma y rutina en un ambiente público. En el fondo, se pueden ver puertas y ventanas, así como un ventilador fijado en el techo en el centro del vagón. Esta escena documenta la realidad cotidiana y atemporal del transporte público urbano, capturando los detalles de las interacciones humanas y los hábitos de viaje de los pasajeros.

French Caption: Cette photographie montre l'intérieur d'une rame de métro, probablement dans une ville animée comme New York dans les années 1970. L'image présente une scène quotidienne avec des passagers assis et debout dans le wagon. Il y a deux rangées de sièges alignés de chaque côté de la rame, avec un espace libre au centre pour permettre la circulation. Les passagers, d'apparence variée et de différents âges, sont principalement absorbés par des activités calmes : beaucoup lisent des journaux, des magazines ou des livres. Les passagers sont vêtus de vêtements typiques de l'époque, avec des vestes en cuir, des manteaux, des chemises à motifs et des pantalons de différentes couleurs et styles. Certains sont debout, tenant les barres et les poignées fixées au plafond pour se stabiliser. On remarque une certaine diversité ethnique parmi les passagers, reflétant peut-être la population urbaine de cette période. Le wagon lui-même est équipé de barres métalliques, de poignées et d'une série de publicités alignées en haut des fenêtres et des murs. La lumière semble jaunie, ce qui pourrait être dû à l'éclairage fluorescent ou simplement à l'âge de la photo. Il y a une atmosphère d'immobilité, avec des passagers concentrés sur leur propre monde, créant une impression de calme et de routine dans un environnement public. À l'arrière-plan, des portes et fenêtres sont visibles, ainsi qu'un ventilateur fixé au plafond au centre de la rame. Cette scène documente une réalité quotidienne et

intemporelle des transports en commun urbains, capturant les détails des interactions humaines et des habitudes de voyage des passagers.
